

What IT change is happening?

Some changes are underway to make our internal systems more secure and to increase protection against phishing and other cyber-attacks. The product we are implementing is called Sentinel 1.

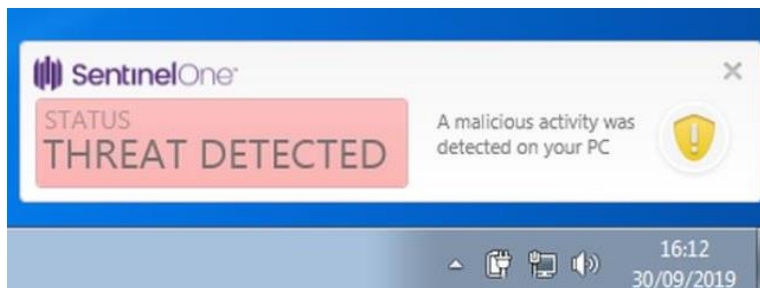

How does this impact me?

We are replacing the Anti-Virus software of “Webroot”, with “Sentinel 1”. This is a new product which is more advanced than traditional virus detection. We will deploy this to all PCs and servers. You shouldn’t notice this happening in the background but the icon below will appear near the clock on your PC and the Webroot icon will no longer appear.

If a virus or other threat is detected, this box will pop up

This will automatically generate a ticket but you should also contact IT immediately.

What happens next?

We are currently preparing for these changes, and more specific details will be sent as we progress with the deployment of these changes.

I have some questions, who do I ask?

Feel free to contact your Forsythes Technology Account Manager or our helpdesk.
